

Integrator forProject™

Rapid, flexible integration
with EVMS forProject

Integrator forProject provides powerful, flexible integration for EVMS forProject, without custom development.

Benefits

Faster solution delivery

Lower integration cost

Reduced technical risk

Easier to adapt as needs or systems change

Systems integration can be a significant challenge when implementing project management systems. Leading organizations recognize the importance of interfacing existing business systems with the project management and Earned Value Management systems and the benefits that can be realized through effective integration.

Trouble is, designing, developing and maintaining these system interfaces too often requires a high degree of specialized knowledge and can represent a difficult, time-consuming and expensive process.

Integrator forProject responds to this challenge by providing fast, powerful, flexible integration capabilities for EVMS forProject, all without the need for expensive custom development.

Examples of systems that can be integrated include:

- Financial accounting systems and Enterprise Resource Planning (ERP) systems such as SAP, Oracle, Unanet or CostPoint
- Customer Relationship Management (CRM) systems
- Product Lifecycle Management (PLM) systems
- Material Planning and Control (MRP) systems
- Supply Chain Management systems
- Any other systems that can communicate via SQL tables, views or flat files

Integration Without Programming

Integrator forProject allows you to import or export data such as actual costs, schedules, resources or progress information directly to/from financial accounting or other systems into EVMS forProject, reducing manual entry, reducing errors and saving time and money.

- Allows automated importing of actual costs and other transaction data into EVMS forProject
- Define maps to import or export data from any other system into EVMS forProject
- Integrations can be configured using mapping and scheduling screens without custom programming
- Uses the built in web services application programming interfaces (APIs) of EVMS forProject Server to ensure data integrity and future version compatibility

Integrator forProject™

Rapid, flexible integration
with EVMS forProject.

Multiple Data Connectors

Integrator forProject enables you to import or export data from multiple data sources including:

- EVMS forProject Server v3.0 or later
- Microsoft Project Server 2013, 2016, 2019 (or later)
- CSV and Text files
- Microsoft SQL Server Tables or Views
- Oracle Database Connector available (optional)
- Unanet ERP Connector

Configurable Integration Maps

- Source fields can be mapped to destination fields
- Rules can be applied to transform data between source and destination
- Error handling and logging options can be specified

Batch Processing and Automatic Scheduling

- Multiple integrations can be combined into a Batch processing job when several interfaces need to be run in sequence
- Integrations can be run “on demand” or can be scheduled to recur on an hourly, daily or other frequency
- Schedules can be set to run for a specific time frame or number of iterations
- Listeners can be configured to monitor specific network folders and to run an integration as new data files appear

System Compatibility

Windows Server 2016, 2019 or later, for server installations

SQL Server 2016 or later, Standard Edition (or greater) for server installations

SQL Server 2016 or later, Express or Standard, for standalone installations

IIS 8 or later

Internet Explorer 10, Edge, Chrome or Firefox
